Little knowledge about wax:

1. Why is the wax too sticky?

You don't melt the wax at the maximum temperature of the wax warmer, causing the melting time to be long and sticky. Usually, the temperature is too cold, which may make it impossible to stir or difficult to stir. It is recommended that you reheat until the honey is thick, otherwise it will affect the hair removal effect.

2. Why is the wax broken?

If the wax coating is too thin or the wax stays on the skin for too long, it will cause breakage.

Therefore, it is recommended that you paint the thick wax and grasp the rhythm of the wax melting. The wax will be peeled off immediately after hardening on the skin.

3. Why can't wax remove the hair?

A: The heating wax beans hair removal is not used at the maximum temperature, so the wax has not yet reached the thick shape of the honey, and the temperature is still slightly cold; B: You don't pay attention to the temperature of the wax for hair removal when you apply it. If the temperature is too

cold, you need to reheat it. It is recommended to keep the wax warm when waxing; C: Please apply according to the growth direction of the wax. If there are messy hairs, repeat the waxing step to remove it;

4. Why is there a residue when tearing off the wax?

The edge residue is caused by the fact that when you apply it, the edges are too thin and do not match the internal pressure. When there is residue, use the torn wax to press the residual wax to remove it.

5. Why can't the wax tear?

Please note that this is not because the wax is too sticky, because the wax is not completely hardened and still has fluidity, please wait until it hardens.
